Math F251X

Calculus I: Final Exam

Name: Solutions

- Section: 9:15 (James Gossell)
 11:45 (Jill Faudree)
 11:45 (Leah Berman)
 Online (James Gossell)

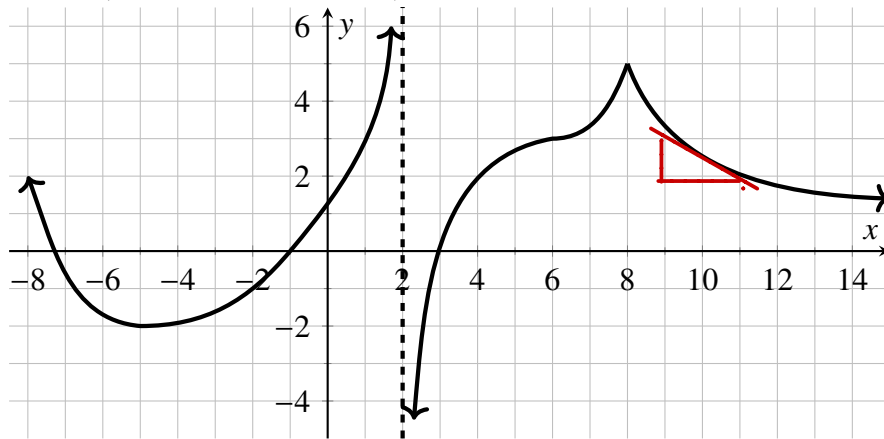

Rules:

- Partial credit will be awarded, but you must **show your work**.
- You may have a single handwritten 3" × 5" notecard, both sides.
- Calculators are **not allowed**.
- Place a box around your FINAL ANSWER to each question where appropriate.
- Turn off anything that might go beep during the exam.
- You have two hours to complete the exam.

Extra Credit	(5)	
Total	100	

1. (16 points)

Consider the graph of the function $f(x)$ shown below, and answer the following questions. You must give the most complete answer; if the value is infinite, write $+\infty$ or $-\infty$.

a. $\lim_{x \rightarrow 2^+} f(x) = -\infty$

b. $\lim_{x \rightarrow 8} f(x) = 5$

c. $\lim_{x \rightarrow 2^+} f'(x) = +\infty$

d. List all x -values where the derivative $f'(x)$ is not defined. $x=2, x=8$

e. Estimate $f'(10) = -\frac{1}{2}$. Explain how you computed your estimate.

I used the tangent line and triangle

f. List all intervals where $f'(x) > 0$. $(-5, 2) \cup (2, 6) \cup (6, 8)$

g. As what x -values does $f(x)$ have... (If none write "none").

A local maximum? $x=8$ A local minimum? $x=-5$

h. The line $y = 1$ is a horizontal asymptote of $f(x)$. Fill in a statement about a limit that corresponds to this fact.

$$\lim_{x \rightarrow \infty} f(x) = 1$$

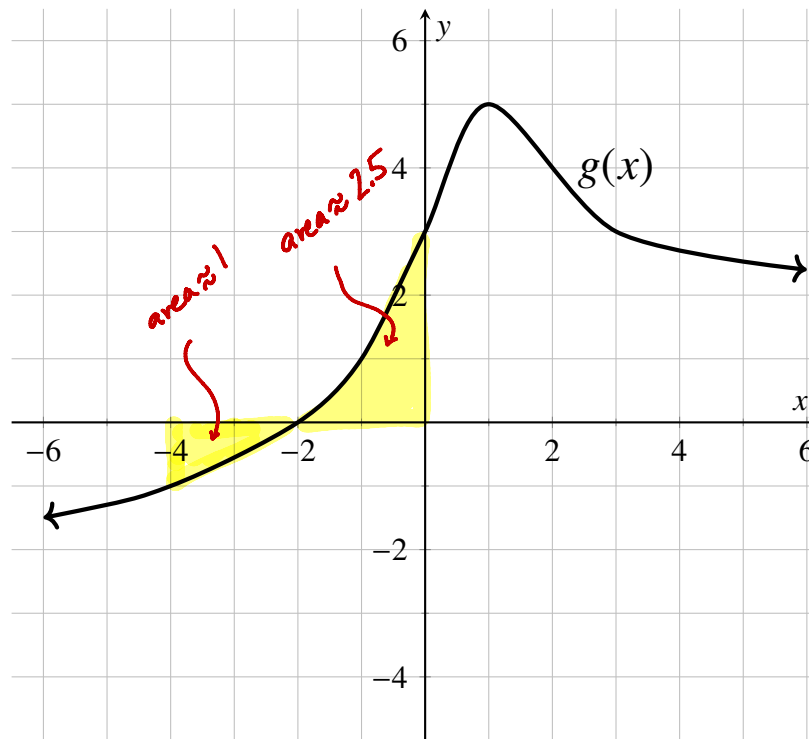

i. Does f have an(y) inflection point(s)? If so, list it/them, if not write "none."

Inflection point(s): $x = 6$

j. On what interval(s) is $f(x)$ concave down? $(2, 6)$

2. (6 points)

The graph of a function $g(x)$ is shown below.

Define a new function $A(x) = \int_{-4}^x g(t) dt$.

- a. On the interval $(-4, 4)$, does $A(x)$ have a local maximum or a local minimum? If so, give the corresponding x -value and **explain** your answer. If not, explain why not.

$A(x)$ has a local minimum at $x = -2$ because $A'(x) = g(x)$ switches from negative to positive.

- b. Estimate $A(0) = 1.5$ and clearly explain what calculation you did to arrive at that estimation. (You may want to draw on the graph as part of your explanation.)

$$A(0) = \int_{-4}^{-2} g(t) dt + \int_{-2}^0 g(t) dt = -1 + 2.5 = 1.5$$

- c. Determine $A'(2) = 4$.

3. (10 points)

Compute the following **integrals**. Give the most general answer, and show your work. Clearly indicate any substitutions you use in such a way that someone else can follow your work.

a. $\int \left(3t^{\frac{2}{7}} - 8t^{-1} + e^{5t-4} + \sin\left(\frac{\pi}{6}\right) \right) dt$

$$= 3 \cdot \frac{7}{9} t^{\frac{9}{7}} - 8 \ln|t| + \frac{1}{5} e^{5t-4} + \frac{1}{2} t + C$$

b. $\int x \cos(x^2) + \frac{1}{\sqrt{1-x^2}} dx = \frac{1}{2} \sin(x^2) + \arcsin(x) + C$

4. (6 points)

Use linearization to estimate $\sqrt{98}$. Show your work, and write your answer as a single decimal or fraction.

Let $f(x) = \sqrt{x}$. Choose $a = 100$. $f'(x) = \frac{1}{2} x^{-1/2}$.

So $f(a) = f(100) = \sqrt{100} = 10$ and $f'(a) = f'(100) = \frac{1}{2} \cdot \frac{1}{\sqrt{100}} = \frac{1}{20}$

Now $L(x) = f(a) + f'(a)(x-a) = 10 + \frac{1}{20}(x-100)$.

Finally, $\sqrt{98} = f(98) \approx L(98) = 10 + \frac{1}{20}(98-100) = 10 + \frac{1}{20}(-2)$
 $= 10 - \frac{1}{10} = 9.9 = \frac{99}{10}$

5. (8 points)

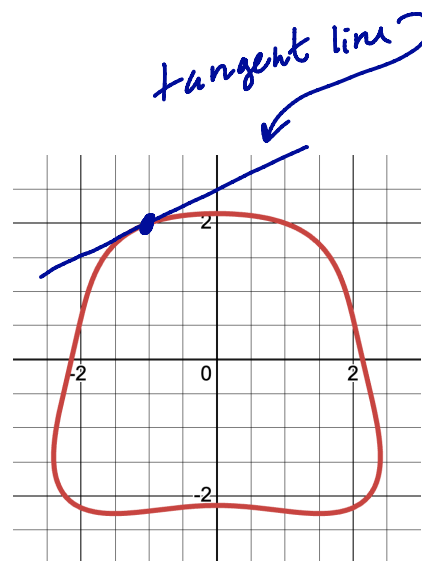

Below is the graph of the curve $x^4 + y^4 + 2x^2y = 21$.

- a. Find $\frac{dy}{dx}$ for the curve $x^4 + y^4 + 2x^2y = 21$.

$$4x^3 + 4y^3 \frac{dy}{dx} + 4xy + 2x^2 \frac{dy}{dx} = 0$$

$$\frac{dy}{dx} = \frac{-(4xy + 4x^3)}{4y^3 + 2x^2}$$

$$= \frac{-(2xy + 2x^3)}{2y^3 + x^2}$$

- b. Write an equation of the line tangent to the curve $x^4 + y^4 + 2x^2y = 21$ at the point $(-1, 2)$.

$$\left. \frac{dy}{dx} \right|_{(-1,2)} = \frac{-(2(-1)2 + 2(-1)^3)}{2(2)^3 + (-1)^2} = \frac{-(-4-2)}{16+1} = \frac{6}{17}$$

$$y - 2 = \frac{6}{17}(x + 1) \quad \text{or} \quad y = 2 + \frac{6}{17}(x + 1) \quad \text{or}$$

Tangent line equation: $y = \frac{6}{17}x + \frac{40}{17}$

- c. Draw the tangent line on the figure above.

6. (9 points)

The Mars rover drops a rock off of a 61 foot cliff. While in free fall, the rock's **velocity** after t seconds is given by the function $v(t) = -12.2t$ feet per second.

- a. Evaluate the integral $\int_0^2 v(t) dt$ and write a sentence to interpret its meaning in the context of the problem. Include units in your answer.

$$\int_0^2 -12.2t dt = -6.1t^2 \Big|_0^2 = -6.1(4) = -24.4 \text{ feet.}$$

In the first two seconds, the rock falls 24.4 feet.

- b. Write a function $h(t)$ that gives the rock's height above the ground after t seconds.

$$h(0) = 61$$

$$h(t) = \int v(t) dt = \int -12.2t dt = -6.1t^2 + C$$

$$\text{So } 61 = h(0) = -6.1(0)^2 + C. \text{ So } C = 61$$

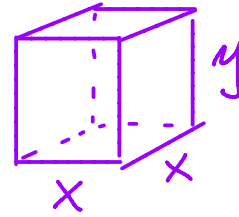

$$\text{Answer: } h(t) = -6.1t^2 + 61$$

- c. What is the **acceleration** due to gravity on Mars? Include units in your answer.

$$a(t) = v'(t) = \frac{d}{dt} [-12.2t] = -12.2 \text{ ft/s}^2$$

7. (11 points)

A box has a square base and an open top. The material for the base costs \$4 per square meter and the material for the sides costs \$1 per square meter. Suppose the width of the base of the box is x meters and its height is y meters.

a. What is the total cost, C , of the box?

$$C = 4x^2 + 4xy$$

b. What is the volume, V , of the box?

$$V = x^2y$$

c. Suppose you have \$24 to spend on the materials for the box.

(i) Write the volume V as a function of one variable and pick a **domain** for this function.

$$24 = 4x^2 + 4xy$$

$$24 - 4x^2 = 4xy$$

$$y = \frac{6}{x} - x$$

$$V(x) = x^2 \left(\frac{6}{x} - x \right) = 6x - x^3$$

$$\text{domain: } (0, \infty) \text{ or } (0, \sqrt{24})$$

(ii) Determine the **dimensions** of the box of **largest** possible volume that fits within your budget.

$$V(x) = 6x - x^3$$

$$V'(x) = 6 - 3x^2 = 0$$

$$x^2 = 2 \text{ or } x = \sqrt{2}$$

Find y :

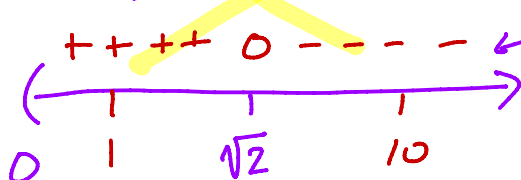

$$y = \frac{6}{\sqrt{2}} - \sqrt{2} = 3\sqrt{2} - \sqrt{2} = 2\sqrt{2}$$

(ignore negative root.)

dimensions (include units): $x = \underline{\sqrt{2} \text{ m}}$ $y = \underline{2\sqrt{2} \text{ m}}$

(iii) **Justify** that your dimensions give the largest volume, using calculus. As part of your justification, **write the name** of the test you are applying (first derivative test, second derivative test, closed interval/extreme value theorem, some other test).

First Derivative Test (only 1 crit #.)

$$V'(1) > 0$$

$$V'(10) < 0$$

So we have a max at $x = \sqrt{2}$

8. (9 points)

Compute the following **limits**. Show your work clearly. Make sure you use **limit notation** where required; an answer that does not use proper notation will not receive full credit. Use = to show things are equal. If you use L'Hôpital's rule, write $\stackrel{H}{=}$ or $\stackrel{L'H}{=}$ to indicate where you are applying it.

$$\text{a. } \lim_{\theta \rightarrow \pi} \frac{1 + \cos(\theta)}{\sin^2(\theta)} = \frac{1 + (-1)}{(0)^2} = \frac{0}{0} \text{ Apply L'Hop}$$

$$\stackrel{H}{=} \lim_{\theta \rightarrow \pi} \frac{-\sin(\theta)}{2\sin(\theta)\cos(\theta)} = \lim_{\theta \rightarrow \pi} \frac{-1}{2\cos(\theta)} = \frac{-1}{2(-1)} = \frac{1}{2}$$

$$\text{b. } \lim_{h \rightarrow 0} \frac{\ln(e+h) - 1}{h} = \frac{\ln(e) - 1}{0} = \frac{0}{0} \text{ apply L'Hop}$$

$$\stackrel{H}{=} \lim_{h \rightarrow 0} \frac{\frac{1}{e+h} \cdot 1}{1} = \frac{\frac{1}{e}}{1} = \frac{1}{e}$$

$$\text{c. } \lim_{x \rightarrow \infty} \left(\frac{-10x^3 + 7x^2}{2x^3 + 3x - 5} \right) \left(\frac{\frac{1}{x^3}}{\frac{1}{x^3}} \right) = \lim_{x \rightarrow \infty} \frac{-10 + \frac{7}{x}}{2 + \frac{3}{x^2} - \frac{5}{x^3}} = \frac{-10}{2} = -5$$

9. (16 points)

At 3:00 pm ($t = 0$), workers discover a break in an oil pipeline. The rate at which oil is flowing from the break is given by $r(t) = \frac{10t}{4+t^2}$, where r is measured in gallons per hour and t is measured in hours.

- a. Find $r(1)$. Write a sentence that someone who has not taken calculus could understand to explain the meaning of $r(1)$. Include units.

$$r(1) = \frac{10}{4+1} = 5 \text{ gal/hr}$$

At 4:00pm oil is leaking at a rate of 5 gallons per hour.

- b. Determine how much oil flowed out of the pipeline between 3:00pm and 5:00pm. Include units in your answer.

$$\int_0^2 \frac{10t}{4+t^2} = 5 \ln(4+t^2) \Big|_0^2 = 5(\ln(8) - \ln(4)) = 5 \ln(2) \text{ gallons}$$

- c. At 4:00pm, is the rate of flow increasing, decreasing or staying the same? Explain how you know.

4:00 pm means $t=1$.

$$r'(t) = \frac{(4+t^2)(10) - (10t)(2t)}{(4+t^2)^2} = \frac{40 - 10t^2}{(4+t^2)^2}; \quad r'(1) = \frac{30}{5^2} > 0$$

At 4:00 pm, the rate of flow is increasing because $r'(1) > 0$.

- d. At what time is the rate of flow of the oil at its maximum? (Give your answer as a time.)

$$r'(t) = 0 \text{ when } 40 - 10t^2 = 0 \text{ or } t = \pm 2.$$

(ignore the negative root)

$r(t)$ is maximized when $t=2$, at 5:00pm.

quick check of correctness

$r'(t) \rightarrow$	+++ 0 ---
	()
	1 2 3
	0 1 2 3 0
	↑
	see (c)

v2

10. (9 points)

Compute the following **derivatives**. Show your work. You do NOT need to simplify your answer. Your answer should start $f'(x)$, $\frac{df}{dx}$ etc.

a. $h(x) = 4 \sec(5x^{-2})$

$$h'(x) = 4 \sec(5x^{-2}) \tan(5x^{-2}) (5(-2)x^{-3})$$

$$= -40x^{-3} \sec(5x^{-2}) \tan(5x^{-2})$$

b. $f(x) = x^{-3} + \sqrt[3]{2x} - 3^x + 3$

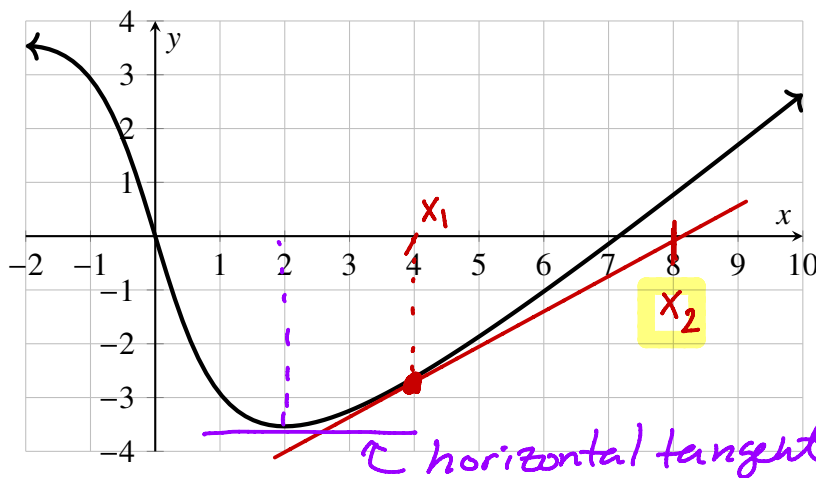

$$f'(x) = -3x^{-4} + \frac{1}{3}(2x)^{-2/3}(2) - (\ln 3)3^x$$

c. $g(x) = \ln\left(\frac{x^6 e^x}{\sqrt{x}}\right) = \ln\left(x^{\frac{11}{2}} e^x\right) = \frac{11}{2} \ln x + x$

$$g'(x) = \frac{11}{2x} + 1$$

alt: $g'(x) = \frac{\sqrt{x}}{x^6 e^x} \cdot \left(\frac{\sqrt{x}(6x^5 e^x - \frac{1}{2}x^{-1/2} x^6 e^x)}{(\sqrt{x})^2} \right)$

Extra Credit (5 points) A portion of the graph of the function $f(x) = x - 5 \arctan(x)$ is shown below.

$$f'(x) = 1 - \frac{5}{1+x^2}$$

$$f'(2) = 1 - \frac{5}{1+2^2} = 0$$

- a. Suppose Newton's method is used to find an approximate solution to $f(x) = 0$ from an initial guess of $x_1 = 4$. **Sketch** on the graph how the next approximation x_2 will be found, **labeling** its location on the x -axis.
- b. If your starting guess is $x_1 = 4$, **compute** x_2 . Show your work. **You do not need to simplify completely**, but your answer should be in a form where typing it into a calculator would compute a numerical value.

$$f'(x) = 1 - \frac{5}{1+x^2}$$

$$x_2 = x_1 - \frac{f(x_1)}{f'(x_1)} = 4 - \left(\frac{x + 5\arctan(4)}{1 - \frac{5}{1+4^2}} \right)$$

- c. What happens if you try to apply Newton's method with a starting guess of $x_1 = 2$?

The method will fail because $f'(2) = 0$.
