

Name: Solutions**Rules:**

You have 90 minutes to complete the exam.

Partial credit will be awarded, but you must show your work.

You may have a single handwritten 3×5 notecard.

Calculators are not allowed.

Place a box around your FINAL ANSWER to each question where appropriate.

Turn off anything that might go beep during the exam.

Good luck!

| Problem | Possible | Score |
|--------------|----------|-------|
| 1 | 10 | |
| 2 | 10 | |
| 3 | 12 | |
| 4 | 14 | |
| 5 | 16 | |
| 6 | 10 | |
| 7 | 8 | |
| 8 | 8 | |
| 9 | 12 | |
| Extra Credit | 5 | |
| Total | 100 | |

1. (10 points) If a airplane is flying at a constant speed of 100 miles per hour and is climbing at a an angle of 30 degrees, at what rate is its altitude changing? Your final answer should include units.

Setup

$$\sin(30^\circ) = \frac{h}{P}$$

want $\frac{dh}{dt}$

$$\text{Know } \frac{dP}{dt} = 100 \text{ mph}$$

$$\text{Recall } \sin(30^\circ) = \frac{1}{2}.$$

$$\text{Use } \frac{1}{2} P = h.$$

$$\text{So } \frac{1}{2} \frac{dP}{dt} = \frac{dh}{dt}$$

$$\text{So } \frac{1}{2} 100 = \frac{dh}{dt}$$

Answer: The height is increasing at a rate of 50 mph.

2. (10 points)

(a) Find the linear approximation, $L(x)$, to $f(x) = \sqrt{x}$ at $a = 25$.

$$f(25) = \sqrt{25} = 5$$

$$f'(x) = \frac{1}{2} x^{-1/2}$$

$$f'(25) = \frac{1}{2} \cdot \frac{1}{\sqrt{25}} = \frac{1}{10}$$

$$y - 5 = \frac{1}{10}(x - 25)$$

$$y = 5 + \frac{1}{10}(x - 25)$$

$$L(x) = 5 + \frac{1}{10}(x - 25)$$

(b) Use your answer in part a to estimate $\sqrt{23}$. Your answer should be in the form of a simplified fraction or a decimal.

$$\sqrt{23} \approx L(23) = 5 + \frac{1}{10}(23 - 25) = 5 - \frac{2}{10} = \frac{48}{10} = 4.8$$

3. (12 points) Evaluate the indefinite integrals below.

$$\bullet (a) \int (8x^{2/3} + \sec(x) \tan(x)) dx = \frac{8x^{5/3}}{\frac{5}{3}} + \sec(x) + C = \frac{24}{5}x^{5/3} + \sec(x) + C$$

$$(b) \int (e^x + 2) dx = e^x + 2x + C$$

$$\bullet (c) \int \frac{1+x^3}{x^2} dx = \int (x^{-2} + x) dx = -x^{-1} + \frac{1}{2}x^2 + C$$

4. (14 points) Let $f(x) = \ln(x^2 + 2)$. It is a fact that $f'(x) = \frac{2x}{x^2 + 2}$ and $f''(x) = \frac{-2(x^2 - 2)}{(x^2 + 2)^2}$.

(a) Determine intervals where $f(x)$ is increasing or decreasing.

$$f'(x) = 0 \text{ at } x = 0 \quad f'(-1) = \frac{-}{+} \quad f'(1) = \frac{+}{+}$$

--- 0 +++ ← sign of f'

←-----→

-1 0 1

Answer:

f is increasing on $(0, \infty)$.

f is decreasing on $(-\infty, 0)$

- (b) Determine the x -values of any local maxima or minima or state that none exist. and state the maximum or minimum values.

Answer: $f(x)$ has a minimum of $\ln(2)$ at $x=0$.

$f(x)$ has no maximum

(c) Determine intervals where $f(x)$ is concave up or concave down.

$$f'' = 0 \text{ when } x = \pm\sqrt{2}$$

--- 0 +++ 0 --- ← sign of f''

←-----→

-10 $-\sqrt{2}$ 0 $\sqrt{2}$ 10

$$f''(-10) = \frac{(-)(+)}{+} = -$$

$$f''(0) = \frac{(-)(-)}{+} = +$$

$$f''(10) = \frac{(+)(+)}{+} = +$$

Answer: f is concave up on $(-\sqrt{2}, \sqrt{2})$, concave down on $(-\infty, -\sqrt{2}) \cup (\sqrt{2}, \infty)$

- (d) Determine the x -values of all inflection points or state that none exist.
Identify

$$(-\sqrt{2}, f(-\sqrt{2})) = (-\sqrt{2}, \ln(4))$$

$$(\sqrt{2}, f(\sqrt{2})) = (\sqrt{2}, \ln(4))$$

5. (16 points) Evaluate the limits below. You must show your work. Indicate an application of L'Hôpital's Rule by putting an H above equal sign.

$$(a) \lim_{x \rightarrow 0} \frac{e^x - \cos(x)}{4 \tan(x)} \underset{\text{form } \frac{0}{0}}{=} \overset{(H)}{=} \lim_{x \rightarrow 0} \frac{e^x + \sin(x)}{4 \sec^2(x)} = \frac{e^0 + \sin(0)}{4 \sec^2(0)} = \frac{1+0}{4 \cdot 1} = \frac{1}{4}$$

$$(b) \lim_{x \rightarrow \infty} \frac{\ln(x)}{x^{1/2}} \underset{\text{form } \frac{\infty}{\infty}}{=} \overset{(H)}{=} \lim_{x \rightarrow \infty} \frac{\frac{1}{x}}{\frac{1}{2} x^{-1/2}} = \lim_{x \rightarrow \infty} \frac{2\sqrt{x}}{x} = \lim_{x \rightarrow \infty} \frac{2}{\sqrt{x}} = 0$$

$$(c) \lim_{x \rightarrow 0^+} (1+x)^{\frac{1}{2x}} = \boxed{e^{1/2}}$$

change

$$\lim_{x \rightarrow 0^+} \frac{1}{2x} \ln(1+x) = \lim_{x \rightarrow 0^+} \underbrace{\frac{\ln(1+x)}{2x}}_{\text{form } \frac{0}{0}} \overset{(H)}{=} \lim_{x \rightarrow 0^+} \frac{\frac{1}{1+x}}{2} = \frac{1}{2}$$

Justify your answer

6. (10 points) An open-topped box with a square base has a fixed surface area of 1200 in^2 . Determine the dimensions of the box with maximum volume.

Goal: Maximize volume $V = x^2 y$

Constraint:

$$\text{Surface area} = S = x^2 + 4xy = 1200$$

$$y = \frac{1200 - x^2}{4x} = 300x^{-1} - \frac{1}{4}x$$

Function: $V(x) = x^2 \left(300x^{-1} - \frac{1}{4}x \right) = 300x - \frac{1}{4}x^3$

domain: $(0, \infty)$

Find crit #'s: $V'(x) = 300 - \frac{3}{4}x^2 = 0$

$$300 = \frac{3}{4}x^2$$

$$x^2 = \frac{4 \cdot 300}{3} = 400$$

$x = \pm 20$ (only the ³positive value in domain)

Justify: $V''(x) = -\frac{6}{4}x$, $V''(20) < 0$. So V is ccdown

at $x = 20$ is the location of a maximum.

Find y. $y = \frac{1200 - 400}{80} = \frac{800}{80} = 10$

Answer: The dimensions that maximize volume are $20 \text{ in} \times 20 \text{ in} \times 10 \text{ in}$.

7. (8 points) The function $f(x) = \frac{24}{x+1}$ is graphed below. We want to estimate the area under the curve $f(x)$ on the interval $[0, 8]$ using M_4 . (That is, we want to use 4 approximating rectangles with midpoints determining height.)

- (a) Sketch the four approximating rectangles on the graph.

- (b) Do a calculation to estimate the area under the curve using M_4 (that is, use 4 approximating rectangles and midpoints) and simplify your answer.

$$\begin{aligned} A &\approx M_4 \\ &= 2(f(1) + f(3) + f(5) + f(7)) \\ &= 2(12 + 6 + 4 + 3) \\ &= 2(25) = \underline{\underline{50}} \end{aligned}$$

8. (8 points) Evaluate the definite integrals below using the graph of $H(x)$ and properties of definite integrals. On the interval $[3, 7]$, the graph of H is a semi-circle. Show your work.

$$\begin{aligned} \text{(a)} \quad \int_{-3}^7 f(x) dx &= \underbrace{\left(\text{area above } x\text{-axis} \right)}_{\text{yellow}} - \underbrace{\left(\text{area below } x\text{-axis} \right)}_{\text{blue}} \\ &= 12 - \frac{1}{2} \pi \cdot 2^2 = 12 - 2\pi \end{aligned}$$

$$\begin{aligned} \text{(b)} \quad \int_0^3 (4f(x) + 6) dx &= 4 \int_0^3 f(x) dx + 6 \int_0^3 1 dx \\ &= 4(6) + 6(3) = 24 + 18 = 42 \end{aligned}$$

$$\begin{array}{r} 1 \\ 24 \\ 18 \\ \hline 42 \end{array}$$

9. (12 points) Sketch a graph that satisfies all the criteria in the list below.

- Domain $(-\infty, \infty)$

- $f(0) = 2$ point $(0, 2)$

- $f'(x) > 0$ f is \nearrow

- $f''(x) < 0$ on $(-\infty, 1)$, $f''(x) > 0$ on $(1, \infty)$
 $\underbrace{\hspace{1.5cm}}_{\text{c c down}} \text{ to } \underbrace{\hspace{1.5cm}}_{\text{c cup}}$

Extra Credit (5 points) Identify all vertical and horizontal asymptotes of the function $f(x) = \frac{4e^x + 1}{7e^x - 1}$. Justify your answer using limits.

horizontal asymptotes: $y = \frac{4}{7}$ and $y = -1$

Justification: $\lim_{x \rightarrow \infty} \frac{4e^x + 1}{7e^x - 1} = \frac{4}{7}$; $\lim_{x \rightarrow -\infty} \frac{4e^x + 1}{7e^x - 1} = \frac{1}{-1} = -1$

vertical asymptotes: $x = \ln(1/7)$ [obtained by solving:
 $7e^x - 1 = 0$ or $e^x = 1/7$]

Justification: $\lim_{x \rightarrow \ln(1/7)^+} \frac{4e^x + 1}{7e^x - 1} = +\infty$

since $4e^x + 1 > 0$ for all x and as $x \rightarrow \ln(1/7)^+$,
 $7e^x - 1 \rightarrow 0^+$.
