Circle one: Rhodes (F01) | Bueler (F02)

25 points possible. No aids (book, calculator, etc.) are permitted. Show all work and use proper notation for full credit.

1. [6 points] A particle is moving with the given acceleration $a(t)$ and other data. Find the position $s(t)$ of the particle.

$$s''(t) = a(t) = 2\cos t - 3\sin t, \quad s(0) = 0, \quad v(0) = 4$$

$$s'(t) = 2\sin t + 3\cos t + C \quad \text{but:} \quad s'(0) = v(0) = 4$$

$$2 \cdot 0 + 3 \cdot 1 + C = 4$$

$$C = 1$$

$$s(t) = -2\cos t + 3\sin t + t + K$$

but:

$$s(0) = 0$$

$$-2 \cdot 1 + 3 \cdot 0 + 0 + K = 0$$

$$K = 2$$

$$s(t) = -2\cos t + 3\sin t + t + 2$$

2. [6 points] The graph of f is shown. Evaluate each integral by interpreting it in terms of areas.

$$\text{a. } \int_{-2}^0 f(x) dx = 3 \cdot 2 = 6$$

$$\text{b. } \int_0^4 f(x) dx = -\int_0^4 f(x) dx = -\left(\frac{1}{2} \cdot 3 \cdot 1 - \frac{1}{2} \cdot 3 \cdot 3\right) = 3$$

$$\text{c. } \int_{-2}^4 f(x) dx = \int_{-2}^0 f(x) dx + \int_0^4 f(x) dx = 6 - 3 = 3$$

3. [8 points] Consider the graph of $f(x) = \frac{1}{1+x}$ below.

$\Delta x = \frac{1}{2}$

- a. In the figure above, sketch four rectangles corresponding to the $n = 4$ Riemann sum on the interval $1 \leq x \leq 3$. Use right endpoints.
 $f(\frac{3}{2}) = \frac{2}{5}, f(2) = \frac{1}{3}, f(\frac{5}{2}) = \frac{2}{7}, f(3) = \frac{1}{4}$
- b. Compute the numerical value of the Riemann sum illustrated in part a. Express your answer as a single fraction.

$$R_4 = f(\frac{3}{2}) \cdot \frac{1}{2} + f(2) \cdot \frac{1}{2} + f(\frac{5}{2}) \cdot \frac{1}{2} + f(3) \cdot \frac{1}{2}$$

$$= \frac{1}{2} (\frac{2}{5} + \frac{1}{3} + \frac{2}{7} + \frac{1}{4}) = \frac{1}{2} (\frac{168 + 140 + 120 + 105}{420})$$

$$= \frac{1}{2} \frac{533}{420} = \frac{533}{840}$$

- c. Is your numerical value in part b an overestimate or an underestimate of $\int_1^3 \frac{1}{1+x} dx$?

Underestimate

$$\begin{array}{r} 11 \\ 168 \\ 140 \\ 120 \\ 105 \\ \hline 533 \end{array}$$

4. [5 points] Use the Midpoint Rule with $n = 2$ subintervals to approximate the integral. Express your answer as a single fraction.

$$\int_0^4 x 2^{-x} dx \approx 2 \cdot f(1) + 2 \cdot f(3)$$

$$= 2 \cdot (1 \cdot 2^{-1}) + 2 \cdot (3 \cdot 2^{-3})$$

$$= \frac{2}{2} + \frac{2 \cdot 3}{2^3} = \frac{7}{4}$$
