Chapter 2: Applications of Integration

- Section 2.1 Areas between Curves Given a region defined by various familiar curves set up and evaluate a definite integral that calculates the area of the region.
- Volumes of Revolution
 - Section 2.2 Volumes by Slicing (disks, washers or defined cross-sections)
 - * Given the base and a characterization of the cross-sections of an object, find its volume.
 - * Given a region R in the xy-plane and an axis or rotation (x- or y-axis), determine the volume using disks or washers.
 - Section 2.3 Volumes of Revolution using Shells
 Given a region *R* in the *xy*-plane and an axis or rotation (*x* or *y*-axis), determine the volume using shells.
- Section 2.4 Arc Length of a Curve and Surface Area
 - Given a curve *C* in the *xy*-plane, find the arc length of *C*.
 - Given a curve *C* in the *xy*-plane and an axis of rotation (*x* or *y*-axis), find the surface area of the volume of rotation.
- Section 2.5 Physical Applications
 - Work. Including Hooke's Law and pumping fluid out of a container.
 - Mass.
- Section 2.7 A Second Look at Exponential and Logarithmic Functions You should know how to integrate and differentiate exponential and logarithmic functions as you did in Calc I.

Chapter 3: Techniques of Integration

- For each technique, you should be able to recognize what integrals are suitable to the technique and know how to implement this technique. **Multiple problems from these Sections always appear on Final Exams.**
 - Section 3.1 Integration by Parts
 - Section 3.2 Trigonometric Integrals
 - Section 3.3 Trigonometric Substitution
 - Section 3.4 Partial Fractions
- Section 3.7 Improper Integrals

How to recognize and evaluate an improper integral. How to determine if an improper integral converges or diverges.

Practical Notes:

- The first step of understanding an improper integral is to rewrite it in terms of a limit.

- You must complete the integration and substitution prior to evaluating the limit.

Chapter 5: Sequences and Series

Multiple problems from this Chapter always appear on Final Exams.

- Section 5.1 Sequences
 - 1. Understand the difference between a *sequence* and a *series*.
 - 2. Know how to write the terms of a sequence whether the terms are given via an explicit formula or a recursive one.
 - 3. Know how to write a formula for a sequence given term-by-term (i.e. look for a pattern and generalize it).
- Infinite Series and Convergence
 - Section 5.2 Infinite Series
 - 1. Know what is meant by *the sequence of partial sums* of a series and be able to find a few of the terms.
 - 2. Know that a series converges if and only if its sequence of partial sums converges. (This is the definition of convergence for series.)
 - 3. Know what a geometric series is and how to determine when it converges and when it diverges. If it converges, know to what it converges.
 - 4. Know that the **harmonic series** is and that it diverges.
 - 5. Know how to identify and exploit the properties of *telescoping series*.
 - Section 5.3 The Divergence and Integral Tests
 - 1. How to use the Divergence Test and know its limits.
 - 2. How to use the Integral Test.
 - 3. Know what is meant by a *p*-series and under what conditions a *p*-series converges and diverges.
 - 4. Any questions about remainders will be extra credit.
 - Section 5.4 Comparison Tests
 - 1. Know how and when to apply the (direct) comparison test and the limit comparison test.
 - Section 5.5 Alternating Series
 - 1. Know what is meant by an alternating series.
 - 2. Know how to apply the Alternating Series Test.
 - 3. Know how to estimate the remainder of a convergent alternating series when the sum of the series is estimated by a partial sum.
 - 4. Know that absolute convergence implies convergence and why this fact is useful.

- 5. Know what you must do to *show* that a series is absolutely convergent.
- 6. Know what you must do to *show* that a series is conditionally convergent.
- Section 5.6 Ratio and Root Tests
 - 1. Know how to apply the ratio test.
 - 2. Know how to apply the root test.
 - 3. Keep in mind that for the root test, you may need to be somewhat careful about your algebra when taking limits.
 - 4. Know how to work with factorials.

Summary: You need to think about what characteristics of series suggest one test or another.

Cautionary Notes:

- You cannot ever assert a series converges or diverges without a justification.
- The only series for which the justification does *not* require the application of a formal test are geometric series, *p*-series, and the harmonic series.

Chapter 6: Power Series

- Section 6.1 Power Series and Functions
 - 1. Know what is meant by a power series centered at x = a.
 - 2. Know how to find the radius of convergence and the center of convergence.
 - 3. Know the power series representation of $f(x) = \frac{1}{1-x}$ and how to use it to find power series representations of other similar functions.
- Section 6.2 Properties of Power Series
 - 1. Know how to operate on power series term-by-term within their radius of convergence including addition, multiplication, differentiation and integration.
- Section 6.3 Taylor and Maclaurin Series
 - 1. Know how to find the Taylor Series of a function f(x) centered at x = a:

$$c_n = \frac{f^{(n)}(a)}{n!}$$
 in $f(x) = \sum_{n=0}^{\infty} c_n (x-a)^n$

- 2. Know how to find the *n*th Taylor polynomial, p_n centered at x = a.
- 3. You should know that a Maclaurin series is a Taylor series with center a = 0.
- 4. Remainder questions will only appear as extra credit.
- Section 6.4 Working with Taylor Series

1. Know how to derive the Maclaurin series for the standard functions:

$$\frac{1}{1-x}, e^x, \sin(x), \cos(x), \ln(1+x), \arctan(x), (1+x)^r.$$

2. Know how to use the methods of integration and differentiation to produce new series (like in Section 6.3).

Chapter 7: Parametric Equations and Polar Coordinates

- Parametric Equations
 - Section 7.1: Parametric Equations
 - 1. know how to sketch a curve described by parametric equations
 - 2. know how to eliminate the parameter
 - Section 7.2: Calculus of Parametric Curves
 - 1. know how to find the find the first and second derivatives of parametric curves.
 - 2. know how to find area under a parametric curve
- Polar Coordinates
 - Section 7.3: Polar Coordinates
 - 1. Know how to plot points given in polar coordinates and how to sketch polar graphs.
 - 2. know how to convert between polar coordinates and rectangular coordinates (for both points and equations)
